## WEST GRAHAM-FIRST NICKEL OPTION

### DRILLING REPORT.

**First Nickel Inc. (“First Nickel”) has entered into an option agreement with Landore Resources Canada Inc. to acquire a 70 per cent. interest in the West Graham property which is strategically located immediately to the south of the East Zone of the Lockerby Mine within the Sudbury basin.**

**First Nickel is carrying out exploration on Landore’s West Graham property and in December 2006 completed its second drilling programme. The following is an extract from their recently published results:**

*“April 2 2007 – Toronto, Ontario – First Nickel Inc. (FNI – TSX) is pleased to report the results of 21 diamond drill holes representing 9,731 metres of diamond drilling on the West Graham Property during the 2006 exploration program.*

*First Nickel’s exploration program was successful in discovering “no seeum” or low sulphide type platinum group element (PGE) mineralization, hosted in the footwall granites stratigraphically below the Conwest Deposit and associated with a Sudbury breccia and less than 5% sulphides. FNI2020, drilled sub parallel to the Sudbury Igneous Complex (SIC) contact in the footwall of the Conwest Deposit, intersected several zones of elevated PGE mineralization including 1.35 metres of 1.82 gpt Pt, 1.17 gpt Pd and 0.77 gpt Au and 0.57 metres of 2.7 gpt Pt, 1.93 gpt Pd and 0.13 gpt Au. All assay intervals reported are core length and do not represent true widths (defined as being measured at right angles to the direction of extension of the sulphide body).*

*This low sulphide, PGE zone represents a new mineralization style not previously recognized on the West Graham Property. Limited exploration has been focused on footwall-hosted mineralization on the West Graham property and the discovery of this new zone of “noseum” style PGE mineralization emphasizes the potential of the West Graham property to host additional footwall zones. Surface mapping has identified Sudbury breccia extending several hundred metres into the footwall granites that will require further follow-up exploration.*

*First Nickel was also successful in extending the disseminated sulphide zone associated with the Conwest Deposit approximately 125 metres to the east of the previously interpreted edge. Several holes intersected significant widths of disseminated nickel-copper*

mineralization, including hole FNI2028 that intersected 71.50 metres of 0.51% Ni and 0.34% Cu including 4.80 metres of 1.04% Ni and 0.31% Cu, and FNI2016 that intersected 19.05 metres of 0.52% Ni and 0.48% Cu.

The reconnaissance drill hole program was designed to test the SIC contact on 50 metres by 150 metres centres to the east of the Conwest Deposit.

The 2006 exploration program has confirmed the presence of a large mineralized system associated with the SIC. The Conwest deposit has been interpreted as the up-plunge extension of the Lockerby East system. Although dominated by lower grade mineralization, the West graham Property remains of considerable interest to First Nickel given the high nickel tenors associated with the sulphide mineralization (on average greater than 6% Ni in 100% sulphide), and the footwall potential of the granites to the south of the Conwest Deposit and the Lockerby East Zone.

Significant Drill Intercepts in the 2006 West Graham Diamond Drill Hole Programs

A \$900,000 exploration program has been proposed for the West Graham Property in 2007. The exploration program will consist primarily of diamond drilling with associated borehole geophysics and may include a component of surface stripping and trenching.”
